

# SPREADER / LIFTING BEAMS

The Eastall Spreader and Lifting Beams are custom-made solutions for efficient lifting of heavy and cumbersome loads.

The **Eastall Spreader Beams** are used where loads are required to be lifted and moved in a horizontal configuration. The load being lifted is spread over the length of the beam giving an even distribution and a safer lift.

The **Eastall Lifting Beams** are generally used where loads are required to be lifted and moved in a horizontal configuration and where the load is being lifted from a single lifting point.

## Benefits of our custom solutions:

- **A One Stop Shop** – beams designed & manufactured in-house minimize lead time and maximize cost effectiveness.
- **Weight reduction** – with thoughtful design and FEA analysis we minimize the amount of steel required to achieve the required lifts.
- **Robust build** – all beam designs are tested with FEA software, certified by an external engineer, and then physically tested after manufacture

## Industries currently using our beams:

|                           |   |
|---------------------------|---|
| <b>Steel Industry</b>     | Roofing and roll forming                |
| <b>Paper Industry</b>     | Coil and roll handling                  |
| <b>Wire Industry</b>      | Wire rope coil handling                 |
| <b>Building Industry</b>  | Materials handling and lifting          |
| <b>Transport Industry</b> | Loading / unloading goods and equipment |
